Childhood Attachment and Relational Trauma Screen (CARTS)

Global Collaboration on Traumatic Stress

The [CARTS](#) project is one the projects conducted by our society in collaboration with other traumatic stress societies worldwide as part the [Global Collaboration on Traumatic Stress](#).

For more information: <https://www.global-psychotrauma.net/carts>

Summary

The [CARTS](#) is a "computer-based self-report measure designed to assess overt instances of childhood maltreatment, as well as the general warmth, security and supportiveness of individuals within the respondents' family and external environment" (Simonelli et al., 2017). It is a computerized survey of individuals' recollections of the quality of their relationships with their family members during childhood, and of relational traumatic experiences occurring during childhood (Frewen et al., 2013, 2015).

We are currently investigating the use of a novel online survey methodology assessing childhood trauma history called the Childhood Attachment and Relational Trauma Screen (CARTS) in several different languages and cultures.

You are invited to complete the CARTS as a survey about individuals' recollections of the quality of their relationships with their family members during childhood, and of relational traumatic experiences occurring during childhood.
